

YANG model for NETCONF Event Notifications

draft-ahuang-netconf-notif-yang-05

The definition of this YANG model allows the encoding of NETCONF Event Notifications in YANG compatible encodings such as JSON and CBOR

YANG model for NETCONF Event Notifications

Entire YANG-Push messages is modeled in YANG

```
module: ietf-notification

structure notification:
  +-- eventTime      yang:date-and-time

{
  "ietf-notification:notification": {
    "eventTime": "2023-02-10T08:00:11.22Z",
    "ietf-yang-push:push-update": {
      "id": 1011,
      "datastore-contents": {
        "ietf-interfaces:interfaces": [
          {
            "interface": {
              "name": "eth0",
              "oper-status": "up"
            }
          }
        ]
      }
    }
  }
}
```

- **YANG model for NETCONF Event Notifications**, [draft-ahuang-netconf-notif-yang](#), updates [RFC 5277](#) by defining the schema as a YANG module.
- Enables YANG-push to define YANG semantics for the entire YANG-push message to support other encodings than XML such as YANG-JSON [RFC 7951](#) or YANG-CBOR [RFC 9264](#).

```
notification push-update {
  description
    "This notification contains a push update that in turn contains data
    subscribed to via a subscription. In the case of a periodic subscription,
    this notification is sent for periodic updates. It can also be used for
    synchronization updates of an on-change subscription. This notification
    shall only be sent to receivers of a subscription. It does not constitute
    a general-purpose notification that would be subscribable as part of the
    NETCONF event stream by any receiver.";
  leaf id {
    type sn:subscription-id;
    description
      "This references the subscription that drove the
      notification to be sent.";
  }
}
```

Notification groupings defined in ietf-yang-push.yang of [RFC 8641](#)

YANG model for NETCONF Event Notifications

draft-ahuang-netconf-notif-yang-05 - Status and Next Steps

Current Status

- Push back from Mohamed Boucadair on -04 working group adoption call.
- -05 addresses the following points:
 - Document updates besides RFC 5277 now also RFC 8639, RFC 7951 and RFC 9254 since RFC 8639 applies the notification statement in YANG-Push and RFC 7951 and RFC 9254 misses the description how to encode the notification statement in JSON and CBOR.
 - Describes the relationship to RFC 5277, RFC 8639, RFC 7951 and RFC 9254 and excludes scoping for Restconf since Section 6 of RFC 8040 describes encoding in JSON.
 - Editorial changes such as examples are moved from the appendix to section 4.

Next Steps

- **Requesting feedback from the netconf working group and YANG-Push implementers.**

Address YANG Specification and Integration Gaps

Aiming for an automated data processing pipeline

YANG Specifications Gaps:

- YANG model for NETCONF Event Notifications
[draft-ahuang-netconf-notif-yang](#) ----->
- Validating anydata in YANG Library context
[draft-aelhassany-anydata-validation](#) ----->

YANG Integration Gaps:

- Support of Network Observation Timestamping in YANG Notifications
[draft-tgraf-netconf-yang-push-observation-time](#) ----->
- Support of Hostname and Sequencing in YANG Notifications
[draft-tgraf-netconf-notif-sequencing](#) ----->
- Support of Versioning in YANG Notifications Subscription
[draft-ietf-netconf-yang-notifications-versioning](#) ----->
- Augmented-by Addition into the IETF-YANG-Library
[draft-linclanetconf-yang-library-augmentation](#) ----->

« Addressing those gaps are a prerequisite to enable an automated data processing chain as described in [draft-ietf-nmop-yang-message-broker-integration](#).

Please consider to attend IETF 120 NMOP working group session on Friday 13:00 – 15:00 or go onto the mailing list and contribute to the discussion. »
