

An Architecture for YANG-Push to Message Broker **Integration**

draft-ietf-nmop-yang-message-broker-integration-09

Motivation and architecture of a native
YANG-Push notifications and YANG Schema integration
into Message Broker and YANG Schema Registry

thomas.graf@swisscom.com

1. November 2025

An Architecture for YANG-Push to Message Broker Integration

Status and Summary from -08

- Addressed comments from Paul Aitken. Many thanks for the review! (<https://mailarchive.ietf.org/arch/msg/hmop/dc8w2524j2RoV3ZduR7t8T0Rt7o/>).
- Paul raised a valid point on YANG and Data Mesh industry adoption claims.

That external references for this claims would help to undermine that this not just the authors opinion.

➤ **The authors believe that the two references would undermine the claim best. Please speak up if you disagree or have a better proposal.**

- Towards Avoiding the Data Mess: Industry Insights from Data Mesh Implementations:
<https://arxiv.org/html/2302.01713v4>
- Toward Building a Semantic Network Inventory for Model-Driven Telemetry:
<https://arxiv.org/html/2402.06511v1>

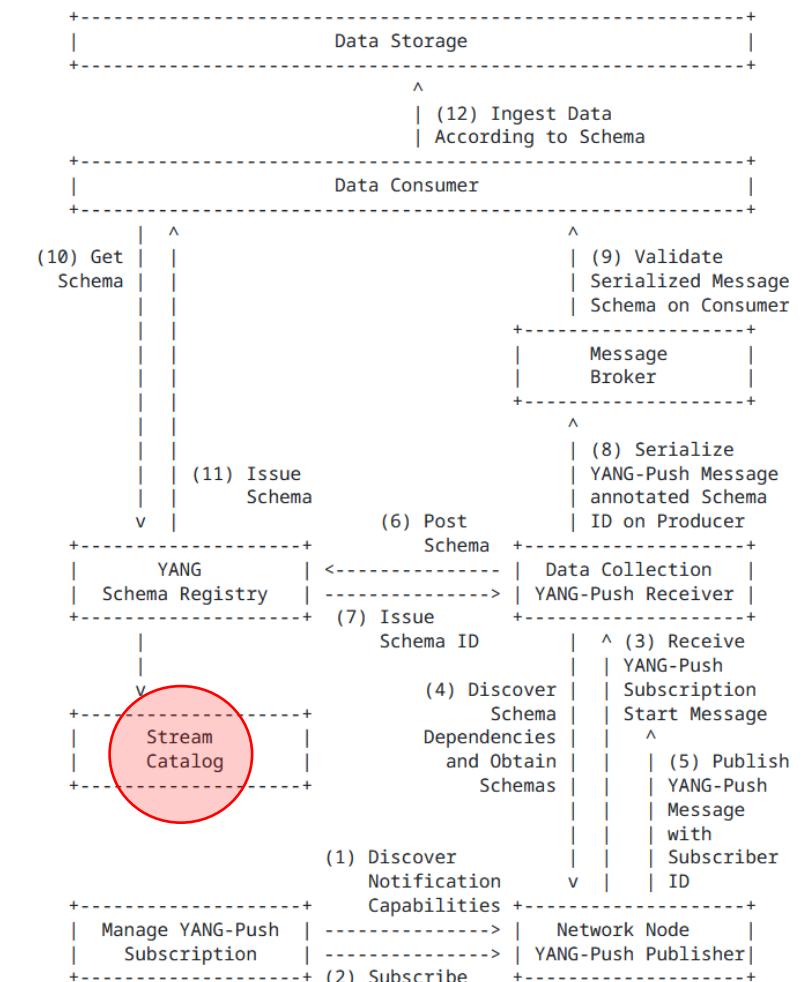

An Architecture for YANG-Push to Message Broker Integration

Status and Summary from -09

- Section 4.5, "Stream Catalog" was added. The term "Stream Catalog" was previously already defined. That semantics are exported to "Stream Catalog" and that end users interact with the "Streaming Catalog" is now clearly defined in the document. All other functional aspects of a "Stream Catalog" is out of document scope.
- Nacho mentioned in during IETF 123 that "Data Catalog" would be a better term than "Stream Catalog". The authors believe that "Stream Catalog" is a more commonly used term in context of Message Brokers. **What is the working group opinion?**
- Changed from "sysName" to "hostname" to adapt to changes in [draft-ietf-netconf-notif-envelope](#).
- Changed message broker examples from RabbitMQ to Apache Pulsar since Apache Pulsar also supports [draft-netana-nmop-yang-message-broker-message-key](#) aspects.

4. Elements of the Architecture

The architecture consists of 6 elements. [Figure 1](#) gives an overview on the workflow.

An Architecture for YANG-Push to Message Broker Integration

Next Steps

Next Steps

- The milestones in the NMOP charter aims September 2025 for "Submit Architecture for YANG-Push to Message Broker Integration to the IESG"
- The document went through several iterations and has multiple implementations. The last remaining normative referenced documents which did not pass working group last call yet are:
 - draft-ietf-netconf-yang-notifications-versioning (requested working group last call at IETF 124)
 - draft-ietf-nmop-message-broker-telemetry-message (second implementation at IETF 124, intend to request working group at IETF 125)
- **The authors suggest to trigger an early OPS directorate review to gauge wherever we have missed anything from an operations or management perspective.**
- **The authors believe that the document is stable and ready for working group last call and be submitted together with draft-ietf-nmop-message-broker-telemetry-message to IESG at IETF 125.**

Extensible YANG Model for Network Telemetry **Messages**

draft-ietf-nmop-message-broker-telemetry-message-03

Defines an extensible message schema in YANG
to be used at data collection to transform Network Telemetry messages
into external systems such as Message Brokers

thomas.graf@swisscom.com

Extensible YANG Model for Network Telemetry Messages

YANG Schema Trees

(1) Optional network node and collector data manifest reused from [draft-ietf-opsawg-collected-data-manifest](#).

(2) Telemetry Protocol Metadata.

(3) Optional network operator metadata.

(4) YANG-Push notification received from the network node.

(5) YANG-Push subscription received from network node.

module: ietf-yang-push-telemetry-message

```
augment-structure /tm:message/tm:telemetry-message-metadata:

Extensible YANG Model for Network Telemetry Messages

Status and Summary from -02

- Addressed comments from Reshad (<https://mailarchive.ietf.org/arch/msg/nmop/MflthPyz61aJ9fX5WgJPJud0us/>) and Rob (<https://mailarchive.ietf.org/arch/msg/nmop/Yi-WE5SgZ1hIxDfYtlgSQQfbC7U/>). Many thanks for the review!
- Reflected changes in ietf-yang-push-telemetry-message yang module node name changes from "[draft-ietf-netmod-yang-semver](#)" from "revision-label" to "version" and "module-name" to "name" to align with <https://datatracker.ietf.org/doc/html/draft-ietf-netmod-rfc8407bis-22#section-4.3.1>.
 - Please note that the described changes also had implications on [draft-ietf-netconf-yang-notifications-versioning-09](#) https://mailarchive.ietf.org/arch/msg/nmop/aefFROi7Pgm3m6xxfovqX_LIQ1c/.

4. Elements of the Architecture

The architecture consists of 6 elements. [Figure 1](#) gives an overview on the workflow.

Extensible YANG Model for Network Telemetry Messages

Status and Summary from -03

- Many thanks to Martin Björklund for the early YANG doctors review. Comments were addressed as bellow. See also https://mailarchive.ietf.org/arch/msg/hmop/cgOnUQDVc_8hb0YOkIMDyBXyCrU/
- identity name change from "yp-push" to "yang-push".
- Introduced missing leaf "notification-event" referencing "telemetry-notification-event-type" identityref to declare notification type of telemetry message. Wherever real-time transformed from network node or generated or removed out of cache in data collector as state update.
- Martin suggested to change "message" container to sx:structure ([RFC 8791](#), data structure) or notification ([Section 4.2.10 of RFC 7950](#)). Considering that it envelops [draft-ietf-netconf-notif-envelope](#), authors opted for "sx:structure".

➤ We like to hear from the working group wherever the YANG doctors input and authors choice make sense. Other opinions?

Extensible YANG Model for Network Telemetry Messages

Next steps at **IETF 124 and 125**

Next Steps

- The document describes in the implementation status section the [NetGauze](#) YANG Message Broker Producer implementation which was validated at IETF 123 hackathon.
- We validated [Pmacct](#) as second YANG Message Broker Producer implementation at IETF 124 hackathon.
 - See separate presentation for details.
- Workflow Engine from Ciena Blue Planet UAA is a YANG Message Broker Consumer implementation which is currently under development and testing.
- The last remaining normative referenced document which did not pass working group last call is [draft-ietf-nmop-yang-message-broker-integration](#).
 - Clarify with NMOP and OPS AD wherever the document should be "informational" or "standards track".
 - The authors believe that the document is stable and once YANG doctors review and input from second implementation has been merged, working group last call at IETF 125 and submitted together with [draft-ietf-nmop-yang-message-broker-integration](#) to IESG can be considered.
