EtherType Protocol Identification of for In-situ OAM Data draft-weis-ippm-ioam-eth-05

Abstract

In-situ Operations, Administration, and Maintenance (IOAM) records operational and telemetry information in the packet while the packet traverses a path between two points in the network. This document defines an EtherType that identifies IOAM data fields as being the next protocol in a packet, and a header that encapsulates the ${\tt IOAM}$ data fields.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute

Weis, et al. Expires August 25, 2022 Commented [TG1]: I suggest to limit the amount of authors to 5 and create a contributor section. See https://datatracker.ietf.org/doc/html/rfc7322#section-

1. Introduction

 ${\tt In-situ\ Operations,\ Administration,\ and\ Maintenance\ (IOAM)\ records}$ operational and telemetry information in the packet while the packet traverses a particular network domain IOAM domain within a network. The term "in-situ" refers to

Weis, et al. Expires August 25, 2022 [Page 2]

the fact that the IOAM data fields are added to the data packets rather than being sent within packets specifically dedicated to OAM. This document proposes a new Ethertype for IOAM and defines how IOAM data fields are carried as part of encapsulations where the IOAM data fields follows an encapsulation header that uses an EtherType to denote the type of protocol data unit. Examples of these protocols are GRE [RFC2784] [RFC2890] and Geneve [RFC8926]). This document outlines how IOAM data fields are encoded in these

encapsultionencapsulation

headers.

2. Conventions

2.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

2.2. Abbreviations

Abbreviations used in this document:

E2E: Edge-to-Edge

Geneve: Generic Network Virtualization Encapsulation

GRE: Generic Routing Encapsulation

In-situ Operations, Administration, and Maintenance IOAM:

Operations, Administration, and Maintenance OAM:

POT: Proof of Transit

3. IOAM EtherType

When the IOAM data fields are included within an encapsulation that identifies the next protocol using an EtherType (e.g., GRE or Geneve) the presence of IOAM data fields are identified with TBD IOAM. When this EtherType is used, an additional IOAM header is also

included inserted before the ethernet frame.

This $\overline{\text{header indicates the type of IOAM}}\ \text{data fields that follows, and}$ the next protocol that follows the IOAM data fields.

Commented [TG2]: I reference to https://www.rfceditor.org/rfc/rfc7799#section-3.8 is advisable and the relationship between in-situ and hybrid type should be established in a terminology section of the document.

It is noteworthy that on this subject there are some controversies and efforts taken in

https://datatracker.ietf.org/doc/html/draft-ietf-opsawgoam-characterization which are not yet resolved but expected to be resolved by the time the this document is

```

The IOAM encapsulation is defined as follows.

IOAM Type: 8-bit field defining the IOAM Option type, as defined in Section 5.1 of $[\underline{rfc9197I-D.ietf-ippm-ioam-data}]$.

IOAM HDR Len: 8 bit Length field contains the length of the IOAM header in 4-octet units.

Next Protocol: 16 bits Next Protocol Type field contains the protocol type of the protocol data unit following IOAM protocol header. Protocol Type is defined to be an EtherType value from [ETYPES]. An implementation receiving a packet containing a Protocol Type which is not listed in one of those registries SHOULD discard the packetframe.

IOAM Option and Data Space: IOAM option header and data is present as specified by the IOAM-Option-Type field, and is defined in Section 5 of [$\underline{rfc9197I-D.ietf-ippm-ioam-data}$].

Multiple IOAM options MAY be included within the encapsulation header. For example, if a GRE encapsulation contains two IOAM options before the data payload, the Next Protocol field of the first IOAM option will contain the value of TBD_IOAM, while the Next Protocol field of the second IOAM option will contain the EtherType indicating the type of the data payload.

4. Usage Examples of the IOAM EtherType

The IOAM EtherType can be used with any encapsulation that uses EtherType to denote the type of the protocol data unit. The following sections show how it can be used when GRE and Geneve are used as the encapsulation header.

Commented [TG3]: As expressed during IETF 123 IPPM working group session, speaking for a SRv6 network operator using L2 EVPN

(https://datatracker.ietf.org/doc/html/rfc3378, https://datatracker.ietf.org/doc/html/rfc9252) to transport Ethernet over a SRV6 network, I would love to see examples related to RFC 3378.

4.1. Example: GRE Encapsulation of IOAM Data Fields

When IOAM data fields are carried in GRE, the IOAM encapsulation defined above follows the GRE header $\underline{\mbox{ and is inserted before the}}$ ethernet or IP header, as shown in Figure 1.

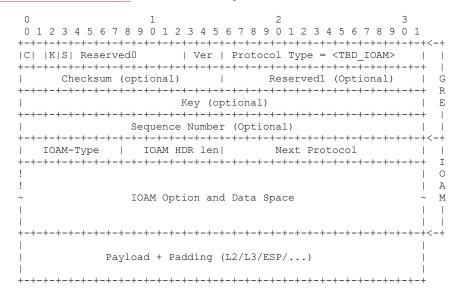

Figure 1: GRE Encapsulation Example

The GRE header and fields are defined in [RFC2890]. GRE can carry ethernet or IP payload. The GRE Protocol
Type value is set to TBD_IOAM.

Figure 2 shows two example protocol header stacks that use GRE along with IOAM. IOAM Option-Types (the below diagram uses "IOAM" as shorthand for IOAM Option-Types) are sequenced in behind the GRE header that follows the "outer" header of the next protocol unit.

Commented [TG4]: That helps the reader to be prepared for Figure 2 where both is shown.

Internet-Draft	EtherTvpe IOAM	February 2022

Example 1	Example 2
TCP/UDP header	IP,
IP header	Eth. header
IOAM	IAM
GRE header	GRE header
IP header	IP header
Layer 2	Layer 2
Layer 1	Layer 1

Figure 2: GRE with IOAM examples

4.2. Example: Geneve Encapsulation of IOAM Data Fields

When IOAM data fields are carried in Geneve, the IOAM encapsulation defined above follows the Geneve header, as shown in Figure 3.

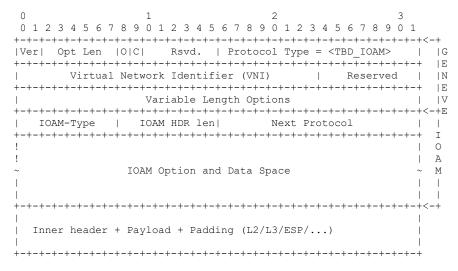

Figure 3: Geneve Encapsulation Example

The Geneve header and fields are defined in [RFC8926]. The Geneve Protocol Type value is TBD IOAM.

5. Security Considerations

This document describes the encapsulation of IOAM data fields in the encapsulation header such as GRE and Geneve that uses EtherType to denote the protocol data unit. Security considerations of the specific IOAM data fields for each case (i.e., Trace, Proof of Transit, and E2E) are described in [section 9 of rfc9197I-D.ietf-ippm-ioam-data].

As this document describes new protocol fields within the existing encapsulation, any security considerations of the respective encapsulation header is applicable. When the encapsulation is GRE, the security considerations of [RFC2890] is applicable. When the encapsulation is Geneve, the security considerations of [RFC8926] is applicable.

IOAM data fields SHOULD be integrity protected (e.g., with [I-D.ietf-ippm-ioam-data-integrity]) to detect changes made by a device between the IOAM encapsulating node and the IOAM decapsulating node.

Commented [TG5]: I suggest to define both terms in the terminology section and refer to https://datatracker.ietf.org/doc/html/rfc9378 for detailing

6. IANA Considerations

A new EtherType value is requested to be added to the [ETYPES] IANA registry by IEEE Registration Authority IEEE 802 Numbers registry. The description should be "In-situ OAM (IOAM)".

7. Acknowledgements

We would like to thank Nagendra Kumar Nainar for the contribution.
