I-D: draft-netana-netconf-notif-envelope-02/03

A. Huang Feng, INSA-Lyon P. Francois, INSA-Lyon T. Graf, Swisscom B. Claise, Huawei

March 18th 2025

Proposal of this I-D

- Structure defined as a notification containing
 - event-time
 - metadata(s)
 - notification-contents

JSON example without metadata

Configured Subscriptions

enable-notif-envelope=True

Dynamic Subscriptions

Proposal of this I-D

- YANG Notification structure for YANG-Push Notifications [RFC 8639/8641]
 - (1) Option to "opt-in" to this notification envelope
 - (2) Able to discover the capability of this new header through "ietf-notification-capabilities"
 - (3) Extensible header defined in YANG 1.1
 - (4) Definition of each encoding (XML, JSON, CBOR)
 - (5) Defines the first base extensions (I-D.tgraf-netconf-notif-sequencing;
 I-D.tgraf-netconf-yang-push-observation-time)

Status

- draft-netana-netconf-notif-envelope-02 discussed in the NMOP/NETCONF joint interim (Feb 10th)
 (https://meetecho-player.ietf.org/playout/?session=IETF-NETCONF-20250210-1500)
- Thanks to all the participants joining the discussions!
- Conclusions from the interim
 - Need to simplify the solution (Don't add new RPCs!)
 - Confirmed interest of having Observation-timestamp as an extension (I-D.tgraf-netconf-yang-push-observation-time)
- WGLC ending March 6th

Changes since -00

- (1) Envelope is enabled and disabled globally
- (2) Added Observation Timestamp extension [draft-tgraf-netconf-yang-push-observation-time]
- (3) Other minor changes

Discussion on change (1) Enabling the envelope globally

- Initial proposal was centralizing requests via an RCP call
 - Feedback: complex to manage
- Current proposal:
 - Switch headers using "/sn:subscriptions/inotenv:enable-notification-envelope"

```
module: ietf-yp-notification

augment /sn:subscriptions:
    +--rw enable-notification-envelope? boolean
    +--rw metadata
```

• When switching this node, existing Subscriptions are tore down:

When there are existing subscriptions and a client changes the node 'enable-notification-envelope', all existing subscriptions MUST be terminated. The publisher MUST send a 'subscription-terminated' notification to all the existing subscriptions using the header configured prior to the change. Any new subscription after the change use the header defined by the node 'enable-notification-envelope', i.e. encoded as Section 3.3.1 when enabled and as defined in [RFC5277] if disabled.

(2) Added Observation Timestamp extension

- Timestamp representing
 - \circ The time the metrics were polled
 - The time the exported event occurred
- Extensions to YANG-Push
- Impact the following YANG-Push Notification <u>only</u>:
 - push-update
 - push-change-update
- Use same mechanism to get the support of this extension via "/sysc:system-capabilities/notc:subscription-capabilities"
- Based on: <u>draft-tgraf-netconf-yang-push-observation-time</u>

```
"ietf-yp-notification:envelope": {
"event-time": "2023-03-25T08:30:12.22Z",
"hostname": "example-router",
"sequence-number": 1,
"notification-contents": {
  "ietf-yang-push:push-change-update": {
    "ietf-yp-observation:timestamp": \
    "2023-03-25T08:30:11.22Z",
    "ietf-yp-observation:point-in-time": \
    "state-changed",
    "datastore-contents": {
      "yang-patch": {
        "patch-id": "patch 54",
        "comment": "Changing encoding to JSON and increasing \
        the period to 10 minutes",
        "edit": [
            "edit-id": "id_change_1",
            "operation": "merge",
            "target": "/ietf-subscribed-notifications\:subs\
            criptions/subscription[id=2222]",
            "value": {
              "ietf-subscribed-notifications:encoding": \
              "ietf-subscribed-notifications:encode-json",
              "ietf-yang-push:periodic": {
                "period": 60000
```

(3) Other minor changes

- The XML namespace has been changed to "urn:ietf:params:xml:ns:yang:ietf-yp-notification"
- "notification-contents" node shorten to "contents"
- "The 'contents' element SHOULD be located at the end of the notification envelope structure."
 - Idea: have the header located at the beginning of the message
- Updated Security Considerations
- Removed "Updates: RFC7950 RFC7951 RFC9254 (if approved)"

What's next?

- All issues/request has been addressed
- Request feedback/comments from the WG

BACKUP

YANG model for NETCONF Event Notifications

Interim 2024-09-19 – draft-ahuang-netconf-notif-yang

- https://datatracker.ietf.org/doc/minutes-interim-2024-netconf-02-202409191300/
- Thorough review of draft-ahuang-netconf-notif-yang/YANG-Push/NETCONF Event Notifications
- Conclusion
 - draft-ahuang-netconf-notif-yang fixes a gap for YANG-Push but might be worth putting the effort on a brand new header
 - O We need:
 - Bypass RFC5277, thus use YANG-Push only
 - Extensible header
 - be able to add new metadata (sequencing, versioning, others...)
 - A client should be able to "opt-in"
 - Clients that don't support this new header should continue working seamlessly
 - The notification should be a YANG-based solution
 - Fix JSON and CBOR underspecification
 - including CBOR-SID allocation

YANG model for NETCONF Event Notifications

Problem statement - (draft-ahuang-netconf-notif-yang)

```
<notification xmlns="urn:ietf:params:xml:ns:netconf:notification:1.0">
<eventTime>2022-09-02T10:59:55.32Z</eventTime>
<push-update xmlns="urn:ietf:params:xml:ns:yang:ietf-yang-push">
 <id>101</id>
 <datastore-contents>
   <interfaces xmlns="urn:ietf:params:xml:ns:yang:ietf-interfaces">
    <interface>
     <name>eth0</name>
    <oper-status>up</oper-status>
   </interface>
  </interfaces>
 </datastore-contents>
</push-update>
</notification>
```

RFC 5277 - Netconf Event Notifications

YANG encodings:

RFC 8641 - YANG Push

- RFC 7950 YANG XML
- RFC 7951 YANG JSON
- RFC 9254 YANG CBOR

```
"ietf-notification:notification": {
  "eventTime": "2017-10-25T08:00:11.22Z",
  "ietf-yang-push:push-update": {
    "id": 1011,
    "datastore-contents": {
       "ietf-interfaces:interfaces": [
          "interface": {
            "name": "eth0",
            "oper-status": "up"
```

Implementation Issues:

- (1) YANG module not defined
- (2) Non-existing Normative text defining this header

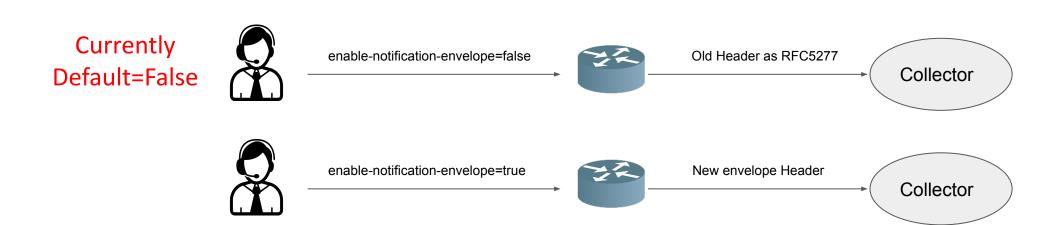

Thanks Andy for confirming the approach was not correct.

Proposal (comments)

- As requested
 - Scoped to YANG-Push (both dynamic and configured subscriptions)
 - Can be implemented with NETCONF and RESTCONF
 - Use a "notification" statement rather than a "sx:structure"
 - Given that it's intended for YANG-Push, the following notifications are impacted:
 - push-update; push-change-update
 - subscription-started; subscription-modified; subscription-terminated
 - subscription-suspended; subscription-resumed; subscription-completed
 - replay-completed

(1) Option to "opt-in" through a YANG-Push Subscription

Configuration on Globally on the server via the RPC "enable-notif-envelope"

- (2) Able to discover the capability of this new header
- Augmentation on notification capabilities (RFC9196)

- (3) Extensible header defined in YANG
- Structure defined as a notification containing
 - event-time

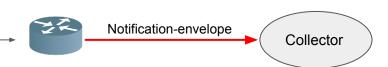

enable-notif-envelope=True

- metadata(s)
- notification-contents

JSON example without metadata

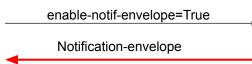

Configured Subscriptions

Dynamic Subscriptions

(4) Definition of each encoding (XML, JSON, CBOR)

- Explicit definition of the content of the "envelope" (solving gap for JSON and CBOR)
 - Definition of the namespace (urn:ietf:params:xml:ns:netconf:notification:2.0)
 - Mandatory event-time node
 - Mandatory notification-contents node
 - Metadata present when configured

A YANG notification encoded in XML is structured as a root "envelope" container. The namespace of this container is the namespace defined in the YANG module "ietf-yp-notification":

urn:ietf:params:xml:ns:netconf:notification:2.0

Two mandatory child nodes within the "envelope" container are expected, representing the event time and the notification payload. The "event-time" node is defined within the same XML namespace as the "envelope" container. The "event-time" node MUST be compliant with [RFC3339]. Other metadata defined within the YANG module defined in Section 5 MUST use the same XML namespace. See Section 3.4 for more details.

- (5) Extensions for hostname and sequence-number
- Definition of hostname and sequence-number extensions (draft-tgraf-netconf-notif-sequencing)
 - Present by default when the envelope is enabled
 - Discovery of support of this header through RFC9196
